APPROVED

OVERALL EVALUATION SCORE

"The project meets the core goal of demonstrating web-application testing and debugging with functional code and Jest tests. Minor improvements such as adding error handling, documentation, and project-level best-practice files will polish the submission. Overall, the work is solid for a beginner and earns approval."

DETAILED FINDINGS (5)

Functionality — MINOR

Network errors from the fetch request are not handled, which could cause uncaught promise rejections.

Add a .catch handler to the fetch chain, e.g., ``` fetch(url) .then(res => res.json()) .then(data => { /* … */ }) .catch(err => { console.error('Failed to load posts:', err); // optionally show a user-friendly message in the UI }); ```

Code Quality — MINOR

Functions lack documentation/comments, making intent less clear for future readers.

Add JSDoc comments above each function, e.g., ``` /** * Returns the sum of two numbers. */ function add(a, b) { return a + b; } ```

Best Practices — MINOR

Console log messages mix Hindi and English and are not user-oriented.

Standardize log messages to a single language and keep them informative, or remove them for production code.

Best Practices — SUGGESTION

Project does not include a .gitignore or linting configuration.

Add a .gitignore (ignore node_modules, .env, etc.) and set up ESLint/Prettier to enforce consistent coding style.

Best Practices — SUGGESTION

README lacks author information, contribution guidelines, and explicit testing instructions beyond npm commands.

Expand the README with sections for "Author", "How to contribute", and detailed steps for running tests and debugging.
